

## CASE STUDY

# TANK DECOMMISSIONING

## BRIEF

One of our most prestigious projects was being involved with the decommissioning of an existing treatment facility for an aviation engineering company which was in desperate need of replacement. The company had new equipment arriving on site within a matter of weeks, so time was of the essence.

## SOLUTION

BKP not only emptied and cleaned the acid baths and spray booths, our team also dismantled them and removed them off site providing safe and legal disposal. All walls and floors were then jet washed and epoxy coated in time for the new tanks to be installed. All the external drainage was cleansed and surveyed using CCTV to ensure no underlying issues. An inventory of packaged waste in drums and IBCs were also evaluated and removed off site for disposal. Once completed, the team provided a full summary of the conducted works along with all the legal paperwork for the client for future reference.
